Reply to the Office Action of 08/12/2005

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method for distributing electronic mail efficiently across a network of information processing units and intermediate nodes, the method on an information processing unit comprising the steps of:
 - receiving a mail message that is created and sent by a user, the user associating the mail message with a plurality of destinations; and
 - sending a single copy of the mail message, in a multicast packet, across the network via at least one intermediate node to destinations corresponding to a plurality of destination network addresses using a reliable multicast technique, wherein the multicast packet includes a packet header comprising the plurality of destination network addresses, wherein at least one of the plurality of destination network addresses is a unicast address, and wherein the mail message is destined for reception at the unicast address as an ordinary unicast packet.
2. (Previously Presented) The method as defined in claim 1, wherein the reliable multicast technique comprises a reliable Small Group Multicast technique.

Appl. No. 09/696,566
Amdt. dated 10/12/05
Reply to the Office Action of 08/12/2005

3. (Currently Amended) An information processing unit for distributing electronic mail efficiently across a network of information processing units and intermediate nodes, the information processing unit comprising:

a reception unit for receiving a mail message with addresses corresponding to a plurality of destinations; and

a transmission unit for sending a single copy of the mail message, in a multicast packet, across the network via at least one intermediate node to destinations corresponding to a plurality of destination network addresses using a reliable multicast technique, wherein the multicast packet includes a packet header comprising the plurality of destination network addresses, wherein at least one of the plurality of destination network addresses is a unicast address, and wherein the mail message is destined for reception at the unicast address as an ordinary unicast packet.

4. (Previously Presented) The information processing unit as defined in claim 3, wherein the reliable multicast technique comprises a reliable Small Group Multicast technique.

5. (Original) The information processing unit as defined in claim 3, wherein the transmission unit operates according to a communication protocol to process ACKs and NAKs as well as packet retransmissions.

6. (Currently Amended) A computer readable medium including instructions for distributing electronic mail efficiently across a network of information processing units and intermediate nodes, the computer readable medium comprising instructions for:
- receiving a mail message with addresses corresponding to a plurality of destinations; and
 - sending a single copy of the mail message, in a multicast packet, across the network via at least one intermediate node to destinations corresponding to a plurality of destination network addresses using a reliable multicast technique, wherein the multicast packet includes a packet header comprising the plurality of destination network addresses, wherein at least one of the plurality of destination network addresses is a unicast address, wherein the mail message is destined for reception at the unicast address as an ordinary unicast packet.
7. (Previously Presented) The computer readable medium as defined in claim 6, wherein the reliable multicast technique comprises a reliable Small Group Multicast technique.

Amdt. dated 10/12/05
Reply to the Office Action of 08/12/2005

8. (Currently Amended) A method for distributing electronic mail across a network of information processing units and intermediate nodes, the method on an intermediate node comprising the steps of:
- receiving a mail message in a multicast packet including a packet header comprising a plurality of destination network addresses, wherein at least one of the plurality of destination network addresses is a unicast address, and wherein the mail message is destined for reception at the unicast address as an ordinary unicast packet;
 - determining one or more "next hops" corresponding to the plurality of destination network addresses in the packet header for forwarding the packet;
 - replicating the packet for each "next hop"; and
 - forwarding one copy of the packet to each of the "next hops".
9. (Original) The method as defined in claim 8, wherein the determining, replicating and forwarding steps operate according to a Small Group Multicast scheme.
10. (Original) The method as defined in claim 8, further comprising the step of:
- repetitively executing the determining, replicating and forwarding steps for each newly received packet.
11. (Original) The method as defined in claim 8, further comprising the steps of:
- processing ACKs and/or NAKs; and
 - performing packet retransmissions.
12. (Previously Presented) The method as defined in claim 8, wherein the multicast packet comprises a Small Group Multicast packet.

Amdt. dated 10/12/05
Reply to the Office Action of 08/12/2005

13. (Currently Amended) A computer readable medium including instructions for distributing electronic mail efficiently across a network of information processing units and intermediate nodes, the computer readable medium comprising instructions for:
- receiving a mail message in a multicast packet including a packet header comprising a plurality of destination network addresses, wherein at least one of the plurality of destination network addresses is a unicast address, and wherein the mail message is destined for reception at the unicast address as an ordinary unicast packet;
 - determining the "next hop" for each destination network address of the plurality of destination network addresses in the packet header; and
 - replicating the packet for each "next hop".
14. (Original) The computer readable medium as defined in claim 13, further comprising the instruction for:
- forwarding a copy of the packet to each "next hop".
15. (Original) The computer readable medium as defined in claim 14, further comprising the instruction for:
- repetitively executing the determining, duplicating and forwarding steps for each newly received packet.
16. (Original) The computer readable medium as defined in claim 15, further comprising the instructions for:
- processing ACKs and/or NAKs; and
 - handling packet retransmissions.

Appl. No. 09/696,566
Amdt. dated 10/12/05
Reply to the Office Action of 08/12/2005

17. (Currently Amended) An intermediate node for distributing electronic mail efficiently across a network of information processing units and intermediate nodes, the intermediate node comprising:

a reception unit for receiving a mail message in a multicast packet including a packet header comprising a plurality of destination network addresses, wherein at least one of the plurality of destination network addresses is a unicast address, and wherein the mail message is destined for reception at the unicast address as an ordinary unicast packet;

a determination unit for determining the "next hop" for each destination network address of the plurality of destination network addresses in the packet header; and

a copying unit for replicating the packet for each of the "next hops".

18. (Original) The intermediate node as defined in claim 17, further comprising:

a forwarding unit for forwarding a copy of the packet to each of the "next hops".

19. (Original) The intermediate node as defined in claim 18, further comprising:

a repeater unit for repetitively executing the determining, duplicating and forwarding steps for each newly received packet.

20. (Original) The intermediate node as defined in claim 19, further comprising:

an acknowledge unit for processing ACKs and/or NAKs; and

a retransmit unit for handling packet retransmissions.
